Class 11122000 Engineered wood products

Definition (if available) A range of derivative wood products which are manufactured by binding together the strands, particles, fibers, or veneers of wood, together with adhesives, to form composite materials. These products are engineered to precise design specifications which are tested to meet national or international standards.

Commodity	Commodity Title	Definition	Synonym
11122001	Plywood	A type of engineered board made from thin sheets of wood, called plies or wood veneers. The layers are glued together, each with its grain at right angles to adjacent layers for greater strength. There are usually an odd number of plies, as the symmetry makes the board less prone to warping and the grain on the outside surfaces runs in the same direction. The plies are bonded under heat and pressure with strong adhesives making plywood a type of composite material.	ベニヤ合板, 합판, Triplex, Plywood
11122002	Particleboard	A type of engineered wood product manufactured from wood particles, such as wood chips, sawmill shavings, or even saw dust, and a synthetic resin or other suitable binder, which is pressed and extruded. Particleboard is a type of fiberboard, a composite material, but it is made up of larger pieces of wood than medium-density fibreboard and hardboard.	集成材, 입자판, Tablex, Spånskiva
11122003	Medium density fiberboard	Building material which combines the technologies of the hardboard and particleboard industries and is manufactured from wood fibers combined with a synthetic resin, usually urea fomaldehyde. It is intended for interior use.	中質繊維板, 중밀도 섬유판, Corrugado, Fiberplatta
11122004	Wood veneers	Wood veneers are constructed of thin slices of real wood which are adhered to the surface of a piece of furniture to give it the glowing appearance of real wood.	木製単板, 무늬목, Enchapes de madera, Träfanér

Commodity	Commodity Title	Definition	Synonym
12361501	1-phenyl-2-propanone	An organic compound with the chemical formula C6H5CH2C(O)CH3. It is a colorless oil that is soluble in organic solvents. This substance is used in the manufacture of methamphetamine and amphetamine, where it is commonly known as P2P	Phenylacetone, P2P
12361502	3,4-methylenedioxyphenyl-2-propanone	A chemical compound consisting of a phenylacetone moiety substituted with a methylenedioxy functional group. It is commonly synthesized from either safrole which, for comparison, is 3-[3,4-(methylenedioxy)phenyl]-2-propene) or its isomer isosafrole via oxidation using the Wacker oxidation or peroxyacid oxidation methods. It is a controlled substance by the US Government on account of its relation to the MDxx chemical class, MDP2P, as well as safrole and isosafrole.	piperonyl methyl ketone, MDP2P, PMK
12361503	Gamma-butyrolactone	A hygroscopic colorless oily liquid with a weak characteristic odor and is soluble in water. GBL is a common solvent and reagent in chemistry and is used as an aroma compound, as a stain remover, as a superglue remover, as a paint stripper, and as a solvent in some wet aluminium electrolytic capacitors. In humans it acts as a prodrug for GHB, and it is used as a recreational intoxicant with effects similar to alcohol.	GBL
12361504	Hydroiodic acid	A mixture derived from Hydrogen iodide HI which usually contains 48% - 57% HI by mass. Currently listed as an illicit drug by the US Government owing to its usefulness as a reducing agent. Reduction with HI and red phosphorus has become the most popular method to produce methamphetamine in the United States.	
12361505	Hypophosphorous acid	A phosphorus oxoacid and a powerful reducing agent with molecular formula H3PO2. It is a colorless low-melting compound, which is soluble in water, dioxane, and alcohols and is used in the formulation of pharmaceuticals, discoloration of polymers, water treatment, retrieval of precious or non-ferrous metals. Its main use is for electroless plating. Currently considered a controlled drug by the US Government because it can reduce elemental iodine to form hydroiodic acid, which is a reagent effective for reducing ephedrine or pseudoephedrine to methamphetamine.	
12361506	N-acetylanthranilic acid	An organic compound with the molecular formula C9H9NO3. It is an intermediate product in catabolism of quinaldine in Arthrobacter sp., and is further metabolized to anthranilic acid. It is classified as an illicit drug precursor by the United Nations.

12361507	Phenylacetic acid	An organic compound containing a phenyl functional group and a carboxylic acid functional group. It is a white solid with a disagreeable odour. Because it is used in the illicit production of phenylacetone (used in the manufacture of meth/amphetamine), it is subject to controls in the United States.	α-toluic acid, benzeneacetic acid, alpha tolylic acid, 2-phenylacetic acid
12361508	Piperonal	An organic compound that is commonly found in fragrances and flavors. The molecule is structurally related to benzaldehyde and vanillin. It exists as a white or colorless solid. It has a floral odor commonly described as being similar to that of vanillin and cherry. It is used as flavoring and in perfumes. Piperonal may be used in the synthesis of 3,4-methylenedioxyamphetamine MDA via the substituted nitrostyrene via a condensation reaction. This intermediate can then be reduced by a strong reducing agent such as lithium aluminium hydride (LiAlH4) to yield MDA. However it can also be used in the illicit production of synthetic drugs like ecstasy and methamphetamine.	heliotropin
12361509	Red phosphorus	A form of phosphorus which is a nonmetallic chemical element with symbol P and atomic number 15. A multivalent pnictogen, phosphorus as a mineral is almost always present in its maximally oxidised state, as inorganic phosphate rocks. Elemental phosphorus exists in two major forms—white phosphorus and red phosphorus—but due to its high reactivity, phosphorus is never found as a free element on Earth. The vast majority of phosphorus compounds are consumed as fertilisers. Other applications include the role of organophosphorus compounds in detergents, pesticides and nerve agents, and matches. It can also be used in the production Methamphetamine via the Nagai route which involves red phosphorus and hydrogen iodide (also known as hydroiodic acid or iohydroic acid).

Class 20123200 Expandable downhole equipment

Definition (if available): Drilling equipment and tubulars that can expand or inflate with help of gas or liquid.Expandable tubular technology concentrates on reducing the telescopic profile of well designs through a downhole tube expansion process. Wider applications of the technology exist for example water shut off, and casing repairs in old wells.To reduce the loss of diameter each time a new casing string or liner is set, a cold working process has been developed whereby the casing or liner can be expanded by up to 20% in diameter after being run down-hole.
